Introduction to **G**fit - A Generic Fitter Project

Goal: provide state-of-the-art model testing tool for LHC era

Introduction to **G**fit - A Generic Fitter Project

Goal: provide state-of-the-art model testing tool for LHC era

1. Input to Gfit

- electroweak precision measurements from **LEP, SLD, TeVatron**
- theoretical predictions

Introduction to Gfitter - A Generic Fitter Project

Goal: provide state-of-the-art model testing tool for LHC era

1. Input to Gfitter

- electroweak precision measurements from **LEP, SLD, TeVatron**
- theoretical predictions

2. Gfitter

- C++, ROOT, xml
- full statistics analysis (parameter scans, p-values, MC analyses, goodness-of-fit tests)

 Gfitter SM

 Gfitter ^{2H}_{DM}

 Gfitter ^B_{SM}

Introduction to **G**fit - A Generic Fitter Project

Goal: provide state-of-the-art model testing tool for LHC era

1. Input to Gfit

- electroweak precision measurements from **LEP, SLD, TeVatron**
- theoretical predictions

2. Gfit

- C++, ROOT, xml
- full statistics analysis (parameter scans, p-values, MC analyses, goodness-of-fit tests)

G fit SM

G fit 2H DM

G fit B SM

3. Physics Results

- **global electroweak fit**
⇒ constraints on M_H
- determination of α_s

Talk: 313 - M. Goebel - "Status of global fit to ew precisions data, constraints on Higgs boson"

- constraints on M_{H^\pm} and $\tan\beta$ in **2HDM**
- observables: K and B sector

Please refer to the main publication

- constraints on **BSM physics** using the oblique parameters

⇒ **Topic of this talk**

Main publication: EPJ C60, 543-583,2009 [arXiv:0811.0009]

The Electroweak Fit with Gfitter

The Electroweak Fit I: SM Fit Results

- input: usage of latest experimental results of electroweak precision observables

- incl. direct Higgs searches (LEP, Tevatron)
- incl. latest average of $m_t = 173.3 \pm 1.1$ GeV (arXiv:1007.3178)

- floating fit parameters: M_Z , M_H , m_t , $\Delta\alpha_{had}^{(5)}(M_Z^2)$, $\alpha_S(M_Z^2)$, \bar{m}_c , \bar{m}_b

- goodness-of-fit:

- excl. direct Higgs searches: $\chi_{min}^2 = 16.4$
 $\Rightarrow \text{Prob}(\chi_{min}^2, 13) = 0.23$

- incl. direct Higgs searches: $\chi_{min}^2 = 17.8$
 $\Rightarrow \text{Prob}(\chi_{min}^2, 14) = 0.22$

- pull values (incl. direct Higgs searches)

- no individual pull exceeds 3σ
- $A_{FB}^{0,b}$ largest contributor to χ_{min}^2
- small contributions from M_Z , $\Delta\alpha_{had}(M_Z)$, m_c , m_b : their input accuracies exceed fit requirements

The Electroweak Fit II: Constraints on Higgs mass

- M_H from fit including all data except results from direct Higgs searches at LEP, Tevatron

- value at minimum $\pm 1\sigma$:

$$M_H = 83_{-23}^{+30} \text{ GeV}$$

- 2σ interval: [42, 159] GeV

- M_H from fit also including results from direct Higgs searches at LEP, Tevatron

- value at minimum $\pm 1\sigma$:

$$M_H = 119.1_{-4.0}^{+13.5} \text{ GeV}$$

- 2σ interval: [114, 157] GeV

⇒ in SM: light Higgs preferred

Constraints on New Physics Models

BSM Constraints using the oblique parameters I

[Peskin and Takeuchi, Phys. Rev. D46, 1 (1991)]

1. **assumption:** high-scale BSM physics appears only through **vacuum polarisation corrections** (cf. rad. corr. from m_t , M_H in SM)

2. ew fit sensitive to BSM physics through these **oblique corrections**

3. oblique corrections from New Physics described through **STU parametrization**

$$O_{meas} = O_{SM,ref}(M_H, m_t) + c_S S + c_T T + c_U U$$

4. STU measure deviations from electroweak radiative correction expected in SM_{ref}

- S: new physics contribution to **neutral current processes**
- U: (+S) new physics contribution to **charged current processes**
 - U only sensitive to M_W and Γ_W
 - usually very small in new physics models (often: $U=0$)
- T: **difference** between neutral and charged current processes (sensitive to **weak isospin violation**)

BSM Constraints using the oblique parameters II

- S, T, U derived from fit to electroweak observables

- SM_{ref} chosen at $m_t = 173.1$ GeV,
 $M_H = 120$ GeV

- **results** for STU and correlation matrix:

$$\begin{array}{l}
 S = 0.02 \pm 0.11 \\
 T = 0.05 \pm 0.12 \\
 U = 0.07 \pm 0.12
 \end{array}
 \quad
 \begin{array}{c|ccc}
 & S & T & U \\
 \hline
 S & 1 & 0.879 & -0.469 \\
 T & & 1 & -0.716 \\
 U & & & 1
 \end{array}$$

- grey area: SM prediction

- for SM_{ref} : $S = T = U = 0$

- S, T: logarithmically dependent on M_H

- comparison of data and SM prediction:

- small M_H compatible with data
 - no need for new physics

BSM Constraints using the oblique parameters II

- S, T, U derived from fit to electroweak observables

- SM_{ref} chosen at $m_t = 173.1$ GeV,
 $M_H = 120$ GeV

- **results** for STU and correlation matrix:

$$\begin{array}{l}
 S = 0.02 \pm 0.11 \\
 T = 0.05 \pm 0.12 \\
 U = 0.07 \pm 0.12
 \end{array}
 \quad
 \begin{array}{c|ccc}
 & S & T & U \\
 \hline
 S & 1 & 0.879 & -0.469 \\
 T & & 1 & -0.716 \\
 U & & & 1
 \end{array}$$

- grey area: SM prediction

- for SM_{ref} : $S = T = U = 0$

- S, T: logarithmically dependent on M_H

- comparison of data and SM prediction:

- small M_H compatible with data
- no need for new physics

- other models also compatible with the data

- UED, 4th fermion generation, Littlest Higgs, ...
- variation of the free parameters allows for large area in ST-plane
- for some parameter values: large M_H allowed (compensation of effects)

One Universal Extra Dimensions

[Appelquist et al., Phys. Rev. D67 055002 (2003)] [Gogoladze et al., Phys. Rev. D74 093012 (2006)]

- all SM particles can propagate into ED
- compactification
⇒ Kaluza-Klein (KK) modes
- conservation of Kaluza-Klein parity
 - similar phenomenology as SUSY
 - lightest KK state stable: CDM
- free parameters of UED model
 - d_{ED} : number of ED (fixed to one)
 - R^{-1} : compactification scale (1/size of extra dimension, $m_{KK} \sim n/R$)
- contribution to vac. polarisation (STU):
 - from KK-top/bottom, KK-Higgs loops
 - dependent on R^{-1} , M_H , m_t
- **results:**
 - large R^{-1} : UED approaches SM (exp.), only small M_H allowed
 - small R^{-1} : UED contribution compensated by large M_H
 - excl. $R^{-1} < 300$ GeV, $M_H > 800$ GeV

Warped Extra Dimensions

[L.Randall, R.Sundrum, Phys. Rev. Lett. 83, 3370 (1999)], [S. Casagrande et al., JHEP10(2008)094]

- introducing one extra dimension (ED) for solving the **hierarchy problem**
- RS model characterized by one warped ED confined by two three-branes
- one brane contains SM particles
- extension: SM particles allowed to propagate in bulk region
- each SM fermion accompanied by two towers of **heavy KK modes**
- free **parameters**
 - M_{KK} : KK scale
 - L : inverse warp factor, function of compactification radius, explaining big observed hierarchy
- **results:**
 - large L requires large M_{KK}
 - compensation if M_H is large

Warped Extra Dimensions with custodial symmetry

[K. Agashe, A. Delgado, M. May, R. Sundrum, , JHEP0308, 050 (2003)], [S. Casagrande et al., JHEP10(2008)094]

- goal: avoid large T values
- introducing so-called **custodial isospin gauge symmetry** in the bulk
- extension of the hypercharge group to $SU(2)_R \times U(1)_X$
- bulk symmetry group:
 $SU(3)_C \times SU(2)_L \times SU(2)_R \times U(1)_X$
 broken to $SU(3)_C \times SU(2)_L \times U(1)_Y$
 on UV brane
- IR brane $SU(2)_R$ symmetric
- right handed fermionic fields occur in doublets
- **results:**
 - almost completely ruled out
 - only small M_H allowed

MSUGRA I

[G. Weiglein: arXiv:hep-ph/9712226v1][S. Heinemeyer, W. Hollik, G. Weiglein: arXiv:hep-ph/0412214v1]

- **Supersymmetry** may solve many shortcomings of the SM (hierarchy problem, unification of coupling constants, DM candidate)
- mSUGRA: highly constraining **breaking mechanism** at GUT scale
- breaking mediated by **gravitational interaction**

- determined by **5 parameters**
 - $m_{1/2}$: mass of fermions at GUT scale
 - m_0 : mass of scalar particles at GUT scale
 - $\tan\beta$: ratio of the two Higgs vacuum expectation values
 - A_0 : trilinear coupling of the Higgs
 - $\text{sgn}\mu$: sign of Higgsino mass term
- radiative corrections dominated by **weak isospin violation** between $m_{\tilde{b}_1}$, $m_{\tilde{t}_1}$ and between $m_{\tilde{t}_1}$, $m_{\tilde{t}_2}$
- by construction of the oblique parameters \Rightarrow T dominant parameter

Softsusy - [B.C. Allanach, Comput. Phys. Commun. 143 (2002) 305-331]

 Superlso - [F. Mahmoudi, JHEP12 (2007), 026]
 microMegas - [G. Bélanger et al., IRFU-10-24, LAPTH-012-10]

MSUGRA II

[G. Weiglein: arXiv:hep-ph/9712226v1][S. Heinemeyer, W. Hollik, G. Weiglein: arXiv:hep-ph/0412214v1]

- low m_0 (and large $\tan\beta$) area excluded by requiring a **non-charged LSP**
- limits on m_0 , $m_{1/2}$, $\tan\beta$ by including in the fit
 - (2) LEP limits on the Higgs mass, on neutralinos and sleptons
 - (3) electroweak precision observables (STU)
 - (4) constraints from $(g_{\mu} - 2)$ and from heavy flavor physics
 - (5) from the relic density
- 95% CL fit contours of the allowed regions are shown

MSUGRA II

[G. Weiglein: arXiv:hep-ph/9712226v1][S. Heinemeyer, W. Hollik, G. Weiglein: arXiv:hep-ph/0412214v1]

- low m_0 (and large $\tan\beta$) area excluded by requiring a **non-charged LSP**
- limits on $m_0, m_{1/2}, \tan\beta$ by including in the fit
 - (2) LEP limits on the Higgs mass, on neutralinos and sleptons
 - (3) electroweak precision observables (STU)
 - (4) constraints from ($g_{\mu} - 2$) and from heavy flavor physics
 - (5) from the relic density
- 95% CL fit contours of the allowed regions are shown

Fourth Family

[Hubisz et al., JHEP 0601:135 (2006)]

- models with a fourth generation
 - SM: no explanation for $n=3$ generations
 - introduction of new states for leptons and quarks ($\Psi_L = (\Psi_1, \Psi_2)_L, \Psi_{1,R}, \Psi_{1,R}$)
- free parameters:
 - masses of new quarks and leptons $m_{u_4}, m_{d_4}, m_{e_4}, m_{\nu_4}$
 - assuming: no mixing of extra fermions
 - model-independent
- contribution to STU from new fermions
- sensitivity to mass difference between up-type and down-type fields, not to absolute mass scale
- results:
 - with appropriate mass differences: 4th fermion model consistent with data
 - large M_H is allowed
 - data prefer a heavier charged lepton

Fourth Family

[Hubisz et al., JHEP 0601:135 (2006)]

- models with a fourth generation
 - SM: no explanation for $n=3$ generations
 - introduction of new states for leptons and quarks ($\Psi_L = (\Psi_1, \Psi_2)_L, \Psi_{1,R}, \Psi_{1,R}$)
- free parameters:

- results:
 - with appropriate mass differences: 4th fermion model consistent with data
 - large M_H is allowed
 - data prefer a heavier charged lepton

Conclusions

Standard model

- global fit of the electroweak SM
- no evidences for physics beyond SM
- inclusion of direct Higgs searches
⇒ Higgs mass strongly constraint
⇒ light Higgs preferred by SM

New physics

- constraints on BSM model parameters using the oblique parameters (ED, mSUGRA, 4th generation, ...)
- heavier Higgs boson allowed in various BSM models

Conclusions

Standard model

- global fit of the electroweak SM
- no evidences for physics beyond SM
- inclusion of direct Higgs searches
⇒ Higgs mass strongly constraint
⇒ **light Higgs preferred by SM**

New physics

- constraints on BSM model parameters using the oblique parameters (ED, mSUGRA, 4th generation, ...)
- **heavier Higgs boson allowed in various BSM models**

Outlook

- further development of the electroweak fit in line with experimental and theoretical progress ⇒ inclusion of Tevatron updates and of course LHC results !!
- extension of the oblique parameter fit (STU), the 2HDM fit
- further development of the SUSY fit

Warped Extra Dimensions

[L.Randall, R.Sundrum, Phys. Rev. Lett. 83, 3370 (1999)], [S. Casagrande et al JHEP10(2008)094]

- introducing one extra dimension (ED) for solving the **hierarchy problem**
- RS model characterized by one warped ED confined by two three-branes
- one brane contains SM particles
- extension: SM particles allowed to propagate in bulk region
- each SM fermion accompanied by two towers of **heavy KK modes**
- free **parameters**
 - M_{KK} : KK scale
 - L : inverse warp factor, function of compactification radius, explaining big observed hierarchy
- **results:**
 - large L requires large M_{KK}
 - compensation if M_H is large

Warped Extra Dimensions with custodial symmetry

[K.Agashe, A.Delgado, M.May, R.Sundrum, JHEP0308, 050 (2003)], [S. Casagrande et al., JHEP10(2008)094]

- goal: avoid large T values
- introducing so-called **custodial isospin gauge symmetry** in the bulk
- extension of the hypercharge group to $SU(2)_R \times U(1)_X$
- bulk symmetry group:
 $SU(3)_C \times SU(2)_L \times SU(2)_R \times U(1)_X$
 broken to $SU(3)_C \times SU(2)_L \times U(1)_Y$
 on UV brane
- IR brane $SU(2)_R$ symmetric
- right handed fermionic fields occur in doublets
- **results:**
 - almost completely ruled out
 - only small M_H allowed

MSUGRA III

[G. Weiglein: arXiv:hep-ph/9712226v1][S. Heinemeyer, W. Hollik, G. Weiglein: arXiv:hep-ph/0412214v1]

- limits on $m_0, m_{1/2}, \tan\beta, A_0$ by including in the fit
 - LEP limits on the Higgs mass, on neutralinos and sleptons
 - electroweak precision observables (STU)
 - constraints from $(g_{\mu} - 2)$ and from heavy flavor physics
 - from the relic density
- 95% CL fit contours of the allowed regions are shown

Littlest Higgs

- Higgs pseudo-Nambu-Goldstone boson
- new fermions and new gauge bosons
 - two new top states (T-odd m_{T^-} , T-even m_{T^+})
 - LH solves hierarchy problem (new particles cancel SM loops)
- T-parity
 - provide dark matter candidate
 - forbids tree-level contribution from heavy gauge bosons to SM observables

- parameters of LH model
 - f : symmetry breaking scale
 - $s_\lambda \cong m_{T^-} / m_{T^+}$

- results:
 - large M_H can be allowed
 - dependent on s_λ :
 - large f : LH approaches the SM prediction and SM MH constraints
 - smaller f : M_H can be large
 - no absolute exclusion limits due to s_λ dependence

Littlest Higgs

- Higgs pseudo-Nambu-Goldstone boson
- new fermions and new gauge bosons
 - two new top states (T-odd m_{T^-} , T-even m_{T^+})
 - LH solves hierarchy problem (new particles cancel SM loops)

- no absolute exclusion limits due to s_λ dependence

2 Higgs Doublet Model

- Type-II
- additional Higgs doublet
- one doublet couples to up-type, one doublet couples to down-type fermions

- 6 free parameters $\Rightarrow M_{H^\pm}, M_{A^0}, M_{H^0}, M_h, \tan\beta, |\alpha|$
- looked at processes sensitive to charged Higgs $\Rightarrow M_{H^\pm}, \tan\beta$
- overlay of individual 95% CL excluded regions
 - assuming ndof=1 and 2-sided limits
- combined fit:
 - ndof ambiguity resolved by MC toy study assuming 2-sided limits
- excluded at 95% CL:
 - small $\tan\beta$
 - for all $\tan\beta$: $M_H < 240$ GeV
 - for $\tan\beta=70$: $M_H < 780$ GeV
